Fourth Quarter 2001

Economic activity in the South Jersey region continued to decline in the final quarter of 2001. But the declines were not as large as in the third quarter, according to businesses polled for the South Jersey Business Survey. Although most indicators of business conditions continued to suggest overall decline in the region, expectations are widespread that growth will return by mid-year.

Current Indicators Mark Continued Declines

The survey’s broadest indicator of regional business conditions, the index of general business activity at individual companies, was -9.9 in the fourth quarter. Although the index has remained negative for five consecutive quarters, it improved markedly from its third-quarter reading (-23.1), the lowest in the 10-year history of the survey (see Chart). Although almost 39 percent of the firms polled reported no change in business activity in the fourth quarter, the percentage reporting decreases in activity (33 percent) was greater than the percentage reporting increases (23 percent). The percentage reporting increases in sales during the fourth quarter (29 percent) was equal to the percentage of firms reporting declines. The current sales index improved significantly from -18.5 to 0. Firms’ responses indicate declines in inventories during the fourth quarter (29 percent) was equal to the percentage of firms reporting declines. The current employment index improved significantly from -18.5 to 0. Firms’ responses indicate declines in inventories during the fourth quarter: almost 30 percent of the firms reported declines in the inventories of their products, and only 11 percent reported increases.

When the poll was taken in mid-January, most firms perceived overall declines in the national, state, and regional economies. More than 59 percent of the firms polled thought the U.S. economy declined in the fourth quarter, and about 46 percent thought there were declines in the state’s economy.

Continued weakness in overall activity was also evident in changes in the firms’ employment levels. The percentage of firms reporting declines in employment (20 percent) was larger than the percentage reporting increases (12 percent) for the third consecutive quarter. But similar to the other broad indicators, the current employment index improved somewhat, increasing from -13.8 to -7.7 in the fourth quarter.

Prices Near Steady But Firms Concerned About Labor Costs

Firms reported near steady prices for their own products in the fourth quarter and little pressure for nonlabor costs. The percentage of firms reporting lower prices for their own products (14 percent) exceeded the percentage of firms reporting higher prices (10 percent). The current prices received index was negative for the second consecutive quarter but was less negative than in the previous quarter. Only 9 percent of firms reported higher prices for raw materials, and about the same percentage (8 percent) reported lower prices.

Labor costs continue to rise. About one-third of the firms reported higher overall costs of wages and benefits in the fourth quarter. Among the most important problems facing South Jersey businesses, labor-related issues (benefits costs, labor quality, and wages) ranked near the top (see Special Question). One year ago only 22 percent of firms cited benefits costs as a major problem.

South Jersey Firms Expect Recovery

South Jersey firms began 2002 with a brighter outlook for economic conditions over the near term. Nearly 64 percent of firms expect an improvement in business activity over the next six months; only 7 percent expect deterioration. Moreover, the future activity index for individual companies increased notably, from 27.7 in the third quarter to 57.1 in the fourth quarter. More firms are also optimistic about recovery in the national, state, and regional economies.

Firms are cautious with regard to their plans to hire additional workers over the
